

Wonder Bumpers

Doctors and researchers have identified traditional crib bumper pads as a health hazard and potential risk for suffocation or strangulation of infants for years. The ties used to attach these pads and the soft and pillow-like fabric they are constructed with can easily smother a sleeping baby or toddler. However, cribs with exposed rails can also be

dangerous if a baby's limbs get caught between them.

Now, there is finally a solution. Wonder Bumpers are the first crib bumper designed to mirror the construction of a crib, providing the comfort and security parents have been searching for and that babies need to rest safely. Wonder Bumpers are different from traditional crib bumpers because they wrap each rail of the crib individually from top to bottom with a secure zipper closure. Wonder Bumpers' sleek, vertical padding, which tightly wraps around each individual crib rail, reflects the vertical design of a crib and enhances the safety features already built into it.

Not only do Wonder Bumpers protect babies' heads and bodies, inhibit toddlers from climbing out of bed, and increase air circulation into the crib, they are also a fashionable addition to any nursery. The reversible zipper on Wonder Bumpers

allows parents to use either side of the bumper to create a custom design for their baby's crib, while also making them easy to use and a breeze to remove for cleaning.

Wonder Bumpers are available in a variety of designs and colors and can be purchased at www.gomamagodesigns.com and specialty retailers nationwide.
